

Burndown.pdf

The burndown chart curve has been decreasing at a steady speed throughout the last two weeks. We managed our subtasks and schedules more punctually in comparison to the previous sprints. It is because we have gotten more experience and are more familiar with our project now. Also, there were no blockers involved among all our user stories, so the code velocity was steady throughout the sprint.

In comparison with Sprint 1 & 2, this sprint's story points were being completed on a more steady basis because the complexity was lower. Also, we have better scheduling and better communication in this sprint.
